Docket No.: 324758001US3

AMENDMENTS TO THE CLAIMS

1. (Currently Amended) A method in a computer system for returning a stream to a task executing an operating system call that is blocked, the computer system having a processor with multiple streams, each stream for executing instructions of a task, the method comprising:

under control of a thread of the task executing on a first stream, making an operating system call; and

when the operating system call blocks,

under control of the operating system executing on a second stream, invoking a function provided by the task to provide the second stream to the task;

under control of the invoked function, executing instructions of the task on the second stream; and

under control of the operating system, notifying the task when the operating system call is complete, wherein the notifying includes,

invoking a function provided by the task using a stream of the operating system; and

under control of that invoked function,

indicating that the operating system call is complete; and invoking another operating system call to return the operating system stream to the operating system.

- 2. (Cancelled)
- 3. (Currently Amended) The method of claim 1 wherein the executing of instructions on that-the second stream includes

indicating that a-the thread that invoked the operating system call is blocked; and executing another thread on that the second stream.

Application No. 10/663,897 Docket No.: 324758001US3

4. (Currently Amended) A system for providing a stream to a task executing an operating system call that is blocked, the system having a processor with multiple streams, each stream for executing instructions of a task, the system comprising:

- a component that, under control of a thread of the task executing on a first stream, makes an operating system call that blocks;
- a component that, under control of the operating system executing on a second stream, invokes a function provided by the task to provide the second stream to the task;
- a component that, under control of the invoked function, executes instructions of the task on the second stream; and
- a component that, under control of the operating system, notifies the task when the operating system call is complete, wherein the notification includes:
 - invoking a function provided by the task using a stream of the operating system; and

under control of that invoked function,

indicating that the operating system call is complete; and invoking another operating system call to return the operating system stream to the operating system.

- 5. (Cancelled)
- 6. (Currently Amended) The system of claim 4 wherein the instructions of the test task executing on that the second stream include:

an indication that a the thread that invoked the operating system call is blocked; and execution of another thread on that the second stream.

7. (Currently Amended) A method in a computer system for assigning a processor stream to a thread of a task, the method comprising:

- under control of a thread of the task executing on a first processor stream, invoking an operating system call that will block and wait for the occurrence of an event: and
- under control of the operating system, when the call is blocked, invoking a <u>first</u> routine of the task so that the routine can assign a second processor stream to another thread of the task;
- under control of the operating system, invoking a second routine of the task using a processor stream of the operating system to indicate that the operating system call is complete; and
- under control of the invoked second routine, invoking another operating system call to return the operating system processor stream to the operating system,
- wherein a processor stream is a component of a processor that supports multiple streams, each stream for executing instructions of a task.
- 8. (Cancelled)
- 9. (Currently Amended) The method of claim 7 wherein the task registers the <u>first</u> routine with the operating system prior to invoking the operating system call.
- 10. (Currently Amended) The method of claim 7 including notifying the task when a the operating system call completes.
- 11. (Currently Amended) A system for assigning a processor stream to a thread of a task, the system comprising:
 - a component for under control of a thread of the task executing on a first processor stream, invoking an operating system call that will block and wait for the occurrence of an event; and

a component for, under control of the operating system, invoking a <u>first</u> routine of the task so that the routine can assign a second processor stream to another thread of the task;

- a component for, under control of the operating system, invoking a second routine
 of the task using a processor stream of the operating system to indicate that
 the operating system call is complete; and
- a component for, under control of the invoked second routine, invoking another operating system call to return the operating system processor stream to the operating system,
- wherein a processor stream is a component of a processor that supports multiple streams, each stream for executing instructions of a task.

12. (Cancelled)

- 13. (Currently Amended) The system of claim 11 wherein the task registers the <u>first</u> routine with the operating system prior to invoking the operating system call.
- 14. (Currently Amended) The system of claim 11 including notifying the task when a-the operating system call completes.
- 15. (Currently Amended) A method in a computer system for returning a stream to a user program, the computer system having an operating system and a processor with multiple streams, each stream for executing instructions of a task, the method comprising: under control of the operating system,
 - when an operating system call in a stream will block, invoking a first function of a the task that will return the stream to the task; and
 - when the operating system call becomes unblocked, invoking a second function of the task to notify the task that the operating system call is complete, wherein the notifying includes,

Application No. 10/663,897 Docket No.: 324758001US3

invoking a second function provided by the task using a stream of the operating system; and

under control of that invoked function,

indicating that the operating system call is complete; and invoking another operating system call to return the operating system stream to the operating system.

- 16. (Original) The method of claim 15 wherein the operating system invokes the first function using the stream that will block.
- 17. (Currently Amended) The method of claim 16 wherein invoking the first function returns the stream <u>that will block</u> to the user program.
- 18. (Currently Amended) The method of claim 17 wherein the user program selects a thread that is not blocked for execution on the stream that will block.
- 19. (Original) The method of claim 15 wherein the second function schedules for restarting a thread that was blocked on the operating system call that was blocked.
 - 20. (Cancelled)
- 21. (Currently Amended) A method in a computer system for returning a stream to a user program, the computer system having an operating system and a processor with multiple streams, each stream for executing instructions of the user program, the method comprising:

under control of the user program, invoking an operating system call; executing the operating system call in a user stream of the user program; and under control of the operating system, when the operating system call will block,

Docket No.: 324758001US3

when a thread making the operating system call is locked, waiting for the operating system call to become unblocked; and

when a thread making the operating system call is not locked,

invoking a first function of the user program that will return the stream to the user program;

under control of a trap handler routine, placing the thread in a blocked pool and selecting another thread to execute on the stream; and

when the operating system call becomes unblocked, invoking a second function of the user program in a stream of the operating system to notify the program that the operating system call is complete, wherein the notifying includes,

invoking a second function of the user program using a stream of the operating system; and

under control of that invoked function,

indicating that the operating system call is complete; and invoking another operating system call to return the operating system stream to the operating system.

- 22. (Original) The method of claim 21 wherein the second function schedules for restarting a thread that was blocked on the operating system call that was blocked.
 - 23. (Cancelled)
- 24. (New) The method of claim 21 wherein the first function and second function of the user program are the same function.
- 25. (New) The method of claim 1 wherein the operating system stream is the first stream.

Application No. 10/663,897 Docket No.: 324758001US3

26. (New) The system of claim 4 wherein the operating system stream is the first stream.

- 27. (New) The method of claim 7 wherein the first and second routines of the task are the same routine.
- 28. (New) The system of claim 11 wherein the first and second routines of the task are the same routine.
- 29. (New) The method of claim 15 wherein the first and second functions of the task are the same function.
